

TAMRO WEB MAINTENANCE (TWM)

Statistics are best when they are presented in a way that suits you. Tamro Web Maintenance (TWM) is a web-based administrative program for the maintenance of registers, helping you to maintain products, districts, customers – and budgets. All you have to do is put the articles in product groups of your choice, scan and create districts and enter budgets for each article or district – according to your specific requirements.

CO-ORDINATED UPDATES

The additions and updates you make in TWM are automatically reflected in Tamro Web Analysis and Tamro Web Reports at the next update, which normally takes place the next day.

Flexible and easy to use

Developed internally at Tamro, TWM is a user-friendly, flexible, easy-to-use system. It gives the user a lot of freedom, as there is virtually no limit to the choice of hierarchies and levels. Statistics are best when they are presented in a way that suits your own specific business requirements.
